

TDP-43 knockdown reduces store-operated Ca^{2+} entry while the transcripts of its components increase

A · Store-operated Ca^{2+} entry falls

B · The discordance

C · Composition, not direction

D · TRPC1 in patient tissue

No high-confidence cryptic splice junction was found in the 51-gene core SOCE panel in ten of eleven comparisons, and cryptic *STMN2* inclusion does not correlate with *TRPC1* within ALS tissue: the transcript changes are candidate explanations for the functional deficit, not a demonstrated mechanism.
