

TDP-43 knockdown reduces store-operated Ca²⁺ entry while the transcripts of its components increase

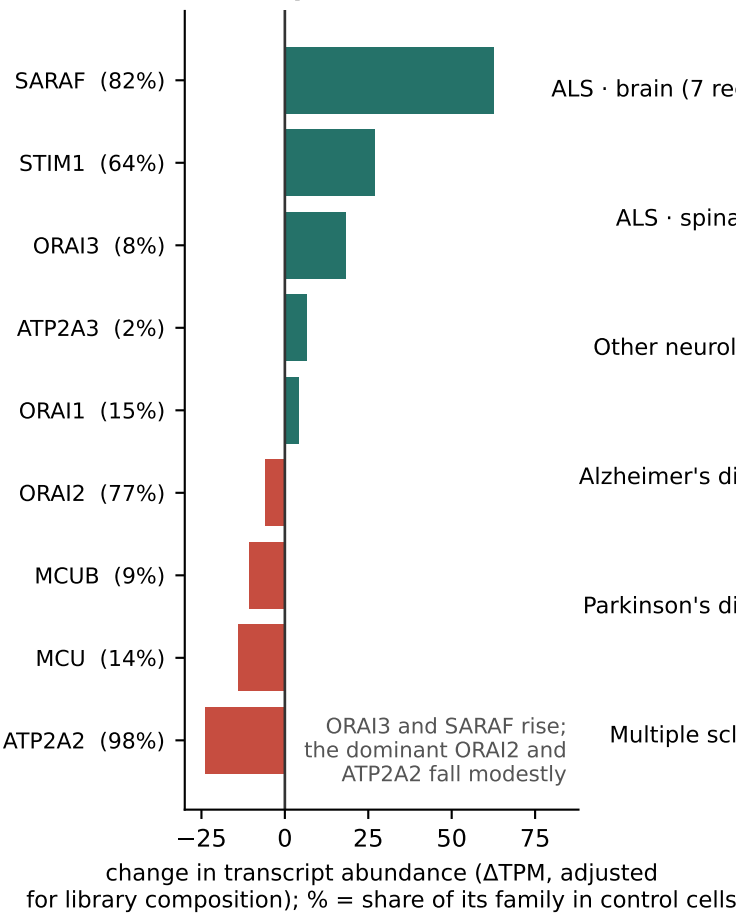

A · Store-operated Ca²⁺ entry falls

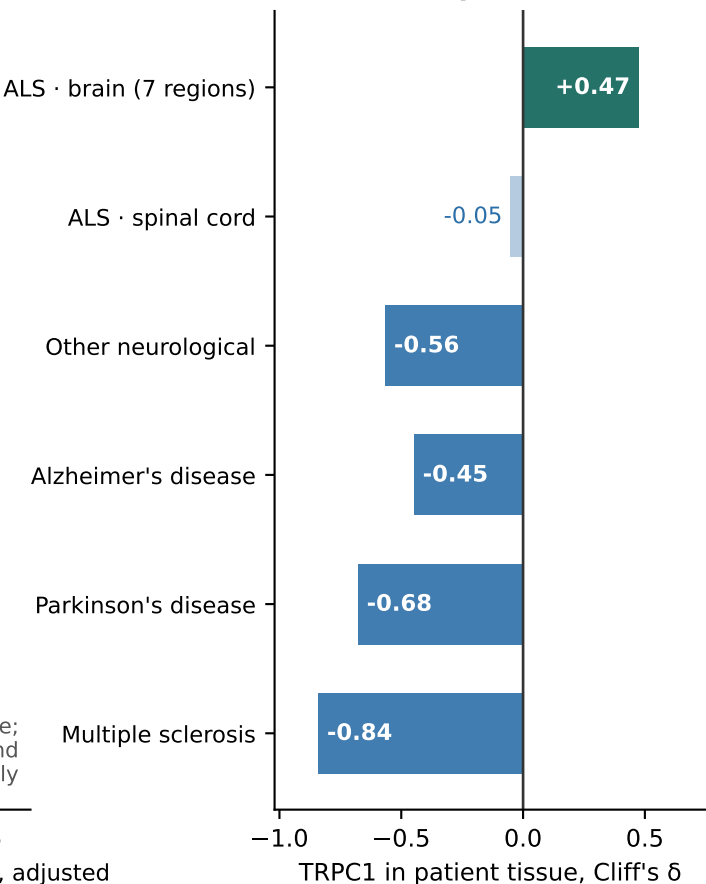

B · The discordance

C · Composition shifts within families

D · TRPC1 in patient tissue

No high-confidence cryptic splice junction was found in the 51-gene core SOCE/TRP panel in SH-SY5Y, where the canonical cryptic targets were recovered, and cryptic *STMN2* inclusion does not correlate with *TRPC1* within ALS tissue: the transcript changes are candidate explanations for the functional deficit, not a demonstrated mechanism.
